Cortical Lobe Projection

New chat

or

</> JSON

```
{
  "LeftParietal":0.61,
  "LeftOccipital":0.39
}
```

if near a boundary.

This is preferable to hard polygon membership.

EEG Electrode Mapping Layer

Store electrode anchors as UV coordinates.

Approximate examples:

Electrode	U	V
Fp1	0.42	0.26
Fp2	0.58	0.26
F3	0.40	0.36
F4	0.60	0.36
C3	0.32	0.45
C4	0.68	0.45
P3	0.34	0.60
P4	0.66	0.60
O1	0.42	0.78
O2	0.58	0.78
T7	0.25	0.50
T8	0.75	0.50

These become anchor points for validating the lobe projection.

What is Still Missing

The actual production dataset would contain:

```
~10,000-100,000 mesh vertices
~20,000-200,000 triangles
8 lobe face sets
continuous boundary curves
UV coordinates
```

derived from:

- MNI152 scalp mesh
- cortical atlas labels
- scalp projection computation

Those numerical vertices are not publicly standardized and cannot be inferred analytically; they must be generated from the source meshes.

So the output above is a complete production specification, but not yet the computed geometry. To obtain the actual boundary coordinates, a mesh-processing run must be performed against the chosen headform and atlas datasets.
